<u>Claims</u>

We claim:

1	1.	A heat exchanger comprising:
2		a. a manifold layer having a first plurality of openings for providing a cooling
3		material to the heat exchanger and a second plurality of openings for removing the
4		cooling material from the heat exchanger; and
5		b. an interface layer coupled to the manifold layer, the interface layer having a
6		plurality of routes that each extends from one of the first plurality of openings and
7		terminates at a corresponding one of the second plurality of openings, the route for
8		carrying the cooling material, the plurality of routes each substantially contained
9		in a plane non-parallel to a heat-exchanging plane.
1	2.	The heat exchanger of claim 1, wherein each route is adjacent to another route, whereby
2		heat can be exchanged between cooling material circulating within adjacent routes.
1	3.	The heat exchanger of claim 2, wherein each route extends from one of the first plurality
2		of openings toward the heat-exchanging plane and then turns to extend away from the
3		heat-exchanging plane toward a corresponding one of the second plurality of openings.
1	4.	The heat exchanger of claim 3, wherein each route is substantially U shaped.
1	5.	The heat exchanger of claim 3, wherein after a route extends from one of the first
2		plurality of openings and before the route extends toward one of the second plurality of
3		openings, the route extends substantially parallel to the heat-exchanging plane.

6. 1 The heat exchanger of claim 1, wherein the interface layer comprises a structural material 2 having a thermal conductivity of at least approximately 20 W/m-K. 7. 1 The heat exchanger of claim 6, wherein the structural material comprises a 2 semiconductor. 8. 1 The heat exchanger of claim 6, wherein the structural material comprises a metal. 9. 1 The heat exchanger of claim 6, wherein the structural material comprises a porous 2 material that defines the plurality of routes. 10. 1 The heat exchanger of claim 9, wherein the porous material comprises a porous metal. 11. The heat exchanger of claim 9, wherein the porous material comprises a silicon foam. 1 1 12. The heat exchanger of claim 6, wherein the structural material exhibits anisotropic 2 etching. 1 13. The heat exchanger of claim 12, wherein the structural material that exhibits anisotropic 2 etching is selected from the group consisting of micro-scale copper tubing and copper 3 filaments. The heat exchanger of claim 6, wherein the structural material comprises a composite of 1 14. 2 materials. 1 15. The heat exchanger of claim 1, wherein the cooling material comprises a liquid.

1 17. The heat exchanger of claim 1, wherein the cooling material comprises a vapor. 1 18. The heat exchanger of claim 1, wherein the cooling material comprises a gas. 19. The heat exchanger of claim 1, wherein the cooling material is air. 1 The heat exchanger of claim 1, wherein the first plurality of openings and the second 1 20. plurality of openings lie substantially in a single plane. 2 21. The heat exchanger of claim 1, further comprising a heat insulator between the first 1 2 plurality of openings and the second plurality of openings. 22. The heat exchanger of claim 21, wherein the heat insulator comprises an air gap. 1 23. The heat exchanger of claim 21, wherein the heat insulator comprises a vacuum gap. 1 24. 1 The heat exchanger of claim 21, wherein the heat insulator comprises an insulating 2 material having a thermal conductivity of approximately 5 W/m-K or less. The heat exchanger of claim 1, wherein a cross-sectional dimension of a route changes as 25. 1 2 it extends from one of the first plurality of openings to one of a second plurality of 3 openings.

The heat exchanger of claim 15, wherein the liquid comprises water.

1

16.

1 26. The heat exchanger of claim 25, wherein a cross-sectional dimension of a route increases 2 uniformly as it extends from one of the first plurality of openings to a corresponding one 3 of the second plurality of openings. 27. The heat exchanger of claim 1, further comprising a heat-generating device coupled to a 1 2 bottom surface of the interface layer. 1 28. The heat exchanger of claim 27, wherein the heat-generating device is formed integrally 2 with the bottom surface of the interface layer. 1 29. The heat exchanger of claim 27, wherein the heat-generating device is a semiconductor 2 device. 1 30. The heat exchanger of claim 1, wherein each route comprises a channel. 1 31. The heat exchanger of claim 1, wherein the plurality of routes is defined by a plurality of 2 pin fins. 1 32. The heat exchanger of claim 31, wherein the plurality of pin fins are positioned cross-2 wise to the plurality of routes. The heat exchanger of claim 1, further comprising a pump coupled to the first plurality of 1 33. 2 openings. 1 34. The heat exchanger of claim 1, wherein the manifold layer and the interface layer form a monolithic device. 2

2 a. forming a manifold layer having a first plurality of openings for providing a 3 cooling material to the heat exchanger and a second plurality of openings for removing the cooling material from the heat exchanger; and 4 5 b. forming an interface layer coupled to the manifold layer, the interface layer having 6 a plurality of routes that each extends from one of the first plurality of openings 7 and terminates at a corresponding one of the second plurality of openings, the 8 route for carrying the cooling material, the plurality of routes each substantially 9 contained in a plane non-parallel to a heat-exchanging plane. 36. The method of claim 35, wherein each route is adjacent to another route. 1 1 37. The method of claim 35, wherein each route extends from one of the first plurality of 2 openings toward the heat-exchanging plane and then turns to extend away from the heat-3 exchanging plane toward a corresponding one of the second plurality of openings. 38. 1 The method of claim 37, wherein each route is substantially U shaped. 1 39. The method of claim 37, wherein after a route extends from one of the first plurality of 2 openings and before the route extends toward one of the second plurality of openings, the 3 route extends substantially parallel to the heat-exchanging plane. 40. 1 The method of claim 35, wherein the interface layer comprises a structural material 2 having a thermal conductivity of at least approximately 20 W/m-K. 1 41. The method of claim 40, wherein the structural material comprises a semiconductor.

A method of forming a heat exchanger comprising:

1

35.

42. 1 The method of claim 40, wherein the structural material comprises a metal. 1 43. The method of claim 40, wherein the structural material comprises a porous material 2 defining the plurality of routes. 1 44. The method of claim 43, wherein the porous material comprises a porous metal. 1 45. The method of claim 43, wherein the porous material comprises a silicon foam. 46. 1 The method of claim 40, wherein the structural material exhibits anisotropic etching. 47. 1 The method of claim 46, wherein the structural material exhibiting anisotropic etching is 2 selected from the group consisting of micro-scale copper tubing and copper filaments. 48. 1 The method of claim 40, wherein the structural material comprises a composite of 2 materials. 49. 1 The method of claim 35, wherein the first plurality of openings and the second plurality 2 of openings lie substantially in a single plane. 1 50. The method of claim 35, further comprising forming a heat insulator between the first 2 plurality of openings and the second plurality of openings. 1 51. The method of claim 50, wherein the heat insulator comprises an air gap. 1 52. The method of claim 50, wherein the heat insulator comprises a vacuum gap.

1 53. The method of claim 50, wherein the heat insulator comprises a material having a thermal 2 conductivity of approximately 5 W/m-K or less. 1 54. The method of claim 35, wherein a cross-sectional dimension of a route changes as it 2 extends from one of the first plurality of openings to a corresponding one of the second plurality of openings. 3 55. The method of claim 54, wherein a cross-sectional dimension of a route increases 1 2 uniformly as it extends from one of the first plurality of openings to a corresponding one 3 of a second plurality of openings. 56. The method of claim 35, further comprising coupling a heat-generating device to a 1 2 bottom surface of the interface layer. 1 57. The method of claim 56, wherein coupling a heat-generating device to a bottom surface 2 of the interface layer comprises integrally forming the heat-generating device to the 3 bottom surface of the interface layer. 58. The method of claim 57, wherein the heat-generating device is a semiconductor device. 1 59. The method of claim 35, wherein each route comprises a channel. 1 60. The method of claim 35, wherein each route is defined by a plurality of pin fins. 1 61. The method of claim 60, wherein the plurality of pin fins are positioned crosswise to the 2 plurality of routes.

1 62. The method of claim 35, wherein the manifold layer and the interface layer form a 2 monolithic device. 1 63. The method of claim 35, wherein the step of forming an interface layer comprises 2 patterning a semiconductor device and etching the patterned semiconductor device to 3 form the interface layer. 1 64. The method of claim 35, wherein the step of forming an interface layer comprises 2 stamping a sheet of metal in the shape of the plurality of routes. 1 65. The method of claim 35, wherein the step of forming an interface layer comprises 2 injection molding a metal in the shape of the plurality of routes. 66. A method of cooling a device comprising transmitting a cooling material from an inlet 1 2 manifold, through a plurality of stacked routes positioned over the device, and to an outlet manifold. 3 67. 1 The method of claim 66, wherein the stacked routes comprise a structural material having 2 a thermal conductivity of at least approximately 20 W/m-K. 1 68. The method of claim 67, wherein the structural material comprises a semiconductor. 69. The method of claim 67, wherein the structural material comprises a metal. 1 70. The method of claim 67, wherein the structural material comprises a porous material that 1 2 defines the plurality of stacked routes.

1 71. The method of claim 70, wherein the porous material comprises a porous metal. 72. 1 The method of claim 70, wherein the porous material comprises a silicon foam. 1 73. The method of claim 67, wherein the structural material exhibits anisotropic etching. 74. 1 The method of claim 73, wherein the structural material exhibiting anisotropic etching 2 comprises a material selected from the group consisting of micro-scale copper tubing and 3 copper filaments. 1 75. The method of claim 67, wherein the structural material comprises a composite of 2 materials. 1 76. The method of claim 66, wherein the plurality of stacked routes comprises pin fins. 1 77. The method of claim 66, wherein the cooling material comprises a liquid. 1 78. The method of claim 77, wherein the liquid is water. 79. 1 The method of claim 66, wherein the cooling material comprises a vapor. 80. The method of claim 66, wherein the cooling material comprises a gas. 1 1 81. The method of claim 66, wherein the cooling material is air.
